

# Omneon ContentManager

**Omneon MediaGrid™ is a highly scalable content storage system that plays an active part in the broadcast workflow. More than just high-performance shared storage for all users within a facility, MediaGrid constantly adapts to the changing resiliency and bandwidth requirements of the broadcast workflow and can actively process stored media. ContentManager provides an easy to use application for file system and user management activities performed by system administrators.**

## INTUITIVE

ContentManager is an easy to use software application for setting, reviewing and changing attributes on associated files, directories and user permissions of the MediaGrid. As an example, administrators can set a file- or directory-level “replication factor” for data protection and access bandwidth purposes to ensure data is replicated an appropriate number of times within the MediaGrid.

ContentManager is a Windows-based application that offers a Windows File Manager-like graphical user interface. It can support one or more MediaGrid systems, reducing the need for separate administrative tools to manage multiple storage systems.

ContentManager is supported on Windows XP and 2000 operating systems.

## SECURE

With ContentManager, administrators can configure user and group permissions by defining Access Control Lists (ACLs). These security checks can be applied to both human users and automation systems.

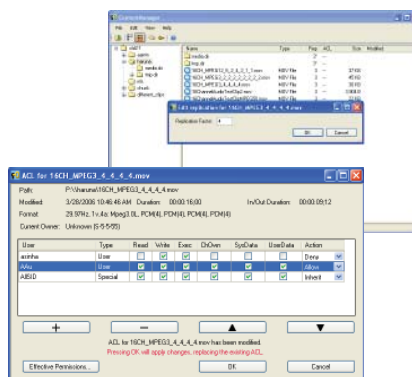

## TROUBLESHOOTING

ContentManager provides a comprehensive logging feature for troubleshooting system issues. Activity logs record all information related to file and user operations. Log level severity can be set to record all minor or major events within a file system to facilitate quick identification of errors and issues.

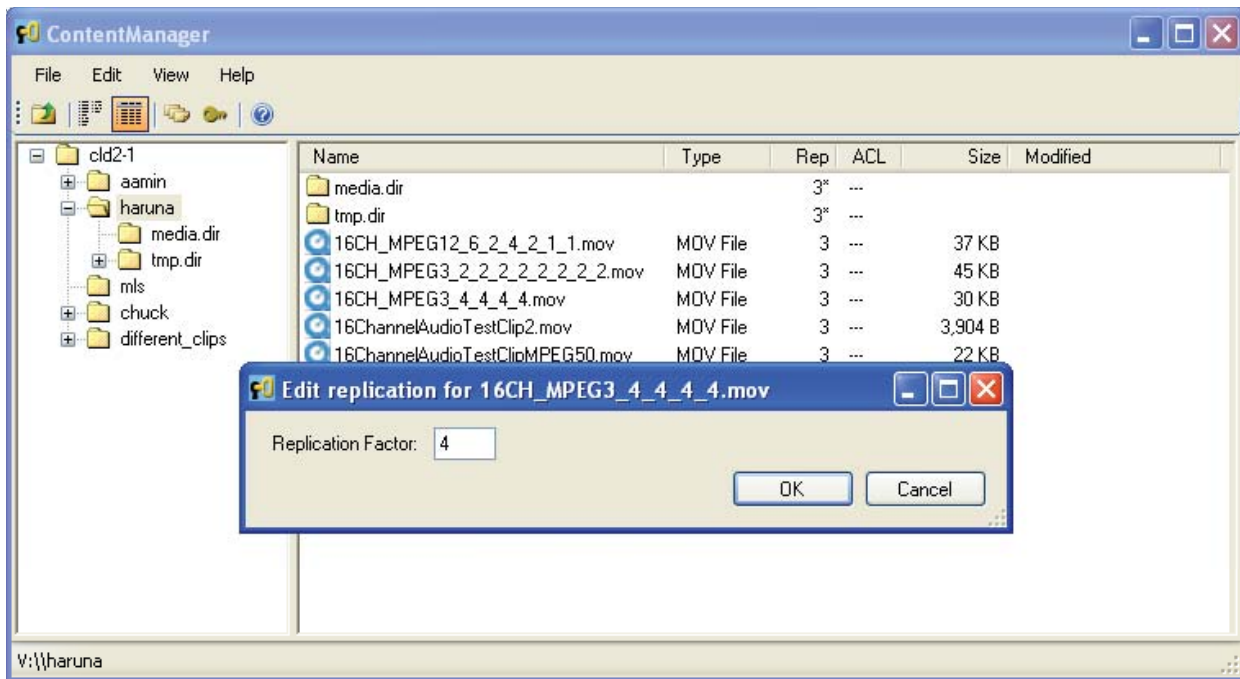

## » BENEFITS

- Enables administrators to intuitively set, review, and change file and user level attributes within MediaGrid
- Provides an easy to understand Windows File Manager-like graphical user interface
- Offers secure control over content with support for user Access Control Lists (ACLs)
- Utilizes user configurable detailed logs for rapid problem resolution

## Omneon ContentManager

Function	Description Summary
<b>Single GUI</b>	Provides a single GUI to manage content on multiple MediaGrid systems.
<b>Set Replication Factor</b>	Intuitive interface that allows users to set the replication factor of files and directories—including clip wrapper and essence components—to provide additional data protection.
<b>Set Security</b>	Allows administrators to control MediaGrid content security by defining ACLs (access control lists) for files and directories.
<b>Log Administration</b>	Allows users to customize logs to the desired level for auditing file system events.
